

Dear Sir or Madam,

DeepMind has achieved outstanding results over the past years with the mission to make the world a better place. This mission should be the drive for every person, every company and any institution, but history tells us it often is not.

Personally, I learned a lot during the past years, where I was able to graduate from KIT with outstanding academic results. I also received a scholarship to work in a leading research group at Carnegie Mellon University and applied my knowledge to several projects during my studies. What distinguishes me from others is that I am always eager to learn more. I have taught myself JavaScript, C# and Python in the afternoons I did not have to study. I still spend my weekends on creating innovative solutions people can benefit of. I have created a solution to automatically generate person images to allow training CNNs without much data, a mobile application for relatives of Alzheimer patients or a gamification application for children to make it more fun taking their medicine.

From August to October, I will work on an education platform together with the German government. My goal is to create a solution millions of people will use, where the platform is intended to be used for people who want to learn something new, primarily because they want or are forced to find a new job.

Having research experience, a solid machine learning background and the strong will to make world a better place, I think I am a great fit for DeepMind and I will love to hear from you soon.

Kind regards,  
Manuel Lang
